A3
post
read
Team messageboard
one append-only board
post or read costs an attempt
earlier rounds only
hidden from the defender
tool calls
Seven bounded tools
list_directory search_files read_file
request_service
post_to_messageboard read_messageboard finish
list, search, read
request_service
Containment (Docker)
Synthetic workspace
read-only to actors
decoy files appear only after commit
source/ pinned SecretStorage source
deployment_notes ops/deploy
integration_records ops/integrations
ci_records ops/ci
runbooks ops/runbooks
at most one deployment per slot
Fixed-upstream bridge
loopback, per-run token
no redirects or proxying
POST /login
GET /get_secret
Honeyval SecretStorage
sec app, fresh each episode
no egress, no published ports
genuine and canary accounts
Compiler creates canary accounts through the bridge.
Detection-first reward
$r_t = 1 \cdot$ [first verified engagement before compromise] $- 1 \cdot$ [first genuine compromise] $- 0.02 \cdot$ [newly committed decoys]
Provisional surrogate. Lead time, attacker cost, and benign disruption are separate. A same-round tie is not a detection. A catch does not stop the team or prove prevention.
